

BREAST HEALTH

Strong Medicine

Memorial's Breast Health Program uses digital mammography, breast sonography, and breast MRI's to define the location of a breast mass. With minimally invasive techniques such as stereotactic breast biopsy to assess a breast abnormality, as well as sentinel node biopsy which uses cutting-edge, pinpoint accuracy to remove the first few lymph nodes into which a tumor drains, our specialized breast surgery team provides treatment options based on your particular diagnosis. And although breast abnormalities aren't always cancer-related, should more advanced treatment be necessary, our Cancer Center offers the latest therapies, including intensity modulated radiation therapy and newest chemotherapy comparable to nationally recognized cancer centers.
